EMTCT Module Data Entry in TSIS2 Report (Omar)

TSIS2 Introduction & Overview Report (Omar)

Executive Summary

The Strategic Information Component Training Report 2026 provides a comprehensive overview To strengthen the elimination of mother-to-child transmission (EMTCT) data management, a training session was conducted on the correct use of the **EMTCT module within TSIS2**. The training focused on data entry workflows, quality standards, and confidentiality requirements to enhance the competencies of data entry clerks, nurses, Monitoring and Evaluation (M&E) officers, and facility HIV focal persons.

Key training activities included:

Key training activities included:

- **EMTCT Module Data Entry Training** conducted with approximately 23 participants, focusing on client record retrieval, pregnancy determination, data entry for pregnancy information and delivery outcomes, newborn record creation, application of data quality standards (completeness, accuracy, timeliness, consistency), and client confidentiality protocols.
 -
- Across the initiative, all participants successfully demonstrated the ability to log in, retrieve a client record, navigate the EMTCT module, add/edit a pregnancy, enter delivery outcomes, and create linked newborn records. Post-training commitments included updating records within 48 hours and performing weekly self-checks for missing data.
- Collectively, this intervention has strengthened institutional capacity in EMTCT data governance, quality assurance, and performance monitoring. The outcomes support improved programme oversight, enhanced data quality, and greater alignment of evidence with policy and strategic decision-making within the national HIV/STI/TB response.

Preface

The Strategic Information Component plays a critical role in supporting Jamaica's HIV response through the collection, management, analysis, and dissemination of high-quality data. Reliable data systems and competent data users are essential to ensuring effective programme implementation, monitoring progress toward national and global targets, and informing evidence-based policy development.

In 2026, the HIV/STI/TB Unit continued its structured programme of capacity-building activities aimed at strengthening data systems utilization. The training documented in this report reflects a deliberate effort to build sustainable competencies in:

- Electronic health information systems (TSIS2 EMTCT module),
- Data quality assurance (completeness, accuracy, timeliness, consistency),
- Client confidentiality protocols,
- Workflow integration for maternal and newborn health data.

This report serves to document the scope, participation, outcomes, and next steps associated with this initiative. It highlights progress made toward strengthening Jamaica's strategic information architecture and reinforces the commitment to continuous quality improvement, data-driven decision-making, and research-informed programming.

Through continued investment in human resource capacity and system enhancement, the Strategic Information Component will remain central to advancing national treatment, prevention, and care objectives and achieving sustained impact in the HIV response.

TSIS2 Training

Introduction

An EMTCT Module Data Entry training session was conducted to support correct use of the EMTCT module within TSIS2. The training focused on data entry workflows, quality standards, and confidentiality requirements.

A total of approximately 23 staff members were trained, including data entry clerks, nurses, M&E officers, and facility HIV focal persons.

Participants

A total of approximately 23 staff members were trained, including data entry clerks, nurses, M&E officers, and facility HIV focal persons.

Training details

The goal of the training was to sensitize staff on the use of the TSIS2 EMTCT module for maternal and newborn HIV data entry and management. The agenda covered:

- **Source documents verification** (ANC records, lab reports, delivery logs)
- **9-step workflow** from client retrieval to final HIV status
- **Quality checks** at each step to prevent duplicate pregnancies and missing data
- **Weekly & monthly data quality reviews**
- **Confidentiality protocols** (login security, log out after use, secure documents)

At the end of the training, staff expressed an improved understanding of the EMTCT module within TSIS2 and demonstrated competency in all key objectives.

Outcomes

All approximately 23 participants successfully demonstrated the ability to:

- Log in and retrieve a client record
- Open the EMTCT module and add/edit a pregnancy
- Enter a delivery outcome and create a linked newborn record

Participants committed to:

- Updating records within 48 hours of receiving documentation
- Performing weekly self-checks for missing data

Next steps

1. Conduct a **follow-up session** in 4–6 weeks to review data quality reports and address ongoing challenges.
2. Assign a **mentor/superuser** at each facility to support colleagues with difficult cases (e.g., retroactive entries, transfers).
3. Integrate the *EMTCT Data Entry Guide* into facility onboarding for new staff.
